Why does skin lose laxity with age?

Collagen is essential for healthy young-looking skin because it gives structures to the cells and supports the dermis. As we age, the production of collagen reduces causing our skin to lose laxity and create wrinkles. This process is natural and can be expedited by environmental factors like smoking, sun exposure and pollution.

How can you sustain your collagen?

You can help sustain your collagen with healthy lifestyle choices and a collagen supporting regimen. Use sunscreen year round, drink plenty of water and help restore your skin firmness and structure with collagen formation treatments.

What is SmoothLiftin™?

SmoothLiftin is an exclusive non-invasive treatment that heats up the skin intraorally and targets volume through a process called collagen induction. The effects are an overall improvement of tightness and elasticity of the skin along with a plumping effect, much like a filler.

What can I expect from the treatment?

SmoothLiftin is an intraoral procedure and will require you to keep your mouth open throughout the duration of the procedure. Each person is different but you can expect minimal to no discomfort during the treatment. Immediately following the treatment, you may experience some redness or swelling that will diminish after a few hours and an immediate tightness and fullness of the area. Most patients can resume their daily activities immediately following the treatment.

Incredible Results...
Noticable after
just 1 Treatment!
